1 Entity-Relationship Diagram (ERD)

The diagram below illustrates the relationships between the core connected entities.

2 Detailed Model Specifications

- **User**: The central identity. Stores authentication (`email`, `password`), profile (`favoriteTeam`), and status (`banned`). Referenced by `Thread`, `Post`, and `Follow`.
- **Follow**: A join table for social connections. It links a `follower` and a `following` user. The composite unique constraint ensures a user cannot follow the same person twice.
- **Appeal**: Allows banned users to request a review. It links to `User` via `userId` and tracks the appeal `reason` and `status` (e.g., PENDING, REJECTED).
- **Match**: Stores game data like `score`, `status`, and `venue`. Referenced by threads to create match dedicated thread.
- **Team**: A reference table containing static club data (name, crest, TLA). Although not heavily linked via foreign keys in the diagram, it provides the source data for team names used in Matches.
- **Thread**: The parent discussion container. Can be optionally linked to a `Match`. Contains `sentimentScore`.
- **Post**: Comments within a thread. Contains `aiModerationScore` to filter toxic content.
- **Reply**: Nested responses to posts.
- **Tag / ThreadTag**: Allows threads to be categorized. `ThreadTag` is the many-to-many link table.
- **Poll**: Attached to a Thread.
- **PollOption**: The choices available in a poll.
- **PollVote**: Records which user voted for which option.
- **Report**: Created when users flag content. It supports polymorphism (can point to `Post` or `Thread`).

ApiCache Designed to store responses from external sports data providers.

- **Function:** Prevents rate-limiting by caching JSON data locally.
- **Key Fields:** `key` (Lookup ID), `data` (JSON string), `expiresAt` (Timestamp for cache invalidation).

Digest A log for system-generated content summaries.

- **Function:** Stores generated newsletters or daily summaries for email distribution.
- **Key Fields:** `content` (The summary text), `createdAt`.

AI Citation: This Entity-Relationship Diagram (ERD) was generated by an Gemini 3.1 pro. **prompt:** Generate a ERD that reflects the core relationship of the entities.
